Service Description

An intranet is a private website by which staff and employees can share internal company information such as messages, documents and other forms of communication. All intranet systems built by Stanton Street are custom-made and based on each client's needs.

While your company may require a calendar to post vacation requests and keep track of employee birthdays, another business may be more concerned about implementing a document repository which can neatly hold and categorize multiple types of documents. Maybe there's a need to track online sales as well as related documents, forms and information. Stanton Street is capable of handling these types of needs and more.

Our experienced staff has developed intranet systems for a variety of client types, including financial institutions, non-profit organizations, real estate developers, travel center networks and a wide array of other businesses which have benefited from their custom built structure.

Phases of Intranet Design and Development

- **Scope Investigation.** We will meet with all stakeholders and develop a comprehensive Scope of Work that describes the development project in detail.
- **Creative Development.** Our graphic designers will combine the requirements of the Scope Document with their knowledge of user behavior as well as accessibility requirements to produce a creative user interface.
- **Project Management.** We manage our internal resources as well as the your team to ensure the project is delivered to scope, on budget, on time.
- **Technical Development (Programming).** Our programmers will develop the inner workings of the intranet. This will include everything from HTML/CSS coding to database development and scripting to support functionality.
